

Supplementary Fig. 3. Adjusted hazard ratios of all-cause mortality associated with baseline glycosylated hemoglobin (HbA1c) level in a Cox model using restricted cubic spline regression. Model was adjusted for age, sex, body mass index, Charlson comorbidity index, socioeconomic status, smoking status, systolic blood pressure, estimated glomerular filtration rate, urine protein/creatinine ratio, low-density lipoprotein cholesterol, Albumin, renin angiotensin aldosterone system inhibitors and statins.
