Supplementary Fig. 3. Trends in the levels of ketone bodies with baseline total ketone levels set at ≥200 μmol/L (A) total ketone, (B) β-hydroxybutyrate, (C) acetoacetate; and at <200 μmol/L, (D) total ketone, (E) β-hydroxybutyrate, (F) acetoacetate. Values are presented as mean±standard deviation. Logarithmically transformed values were used for comparisons of fasting glucagon, total ketone, β-hydroxybutyrate, and acetoacetate. *P<0.05: paired t-test between the baseline and after treatment.
