

Supplementary Fig. 1. The artery for adenovirus injection was identified with trypan blue injection into the (A) celiac artery and (B) cranial mesenteric artery. We attempted both injection sites for adenoviruse (Ad)-green fluorescent protein, Ad-pancreatic and duodenal homeobox 1 (Pdx1), and Ad-PMB (Pdx1, V-maf musculoaponeurotic fibrosarcoma oncogene homolog A [MafA], and BETA2/NeuroD) and confirmed the difference. (C) Preinjection and (D) postinjection into the cranial mesenteric artery.
